

ANTENNA MODELING FOR BEGINNERS

Jonathan Woo W6GX

June 27 2013

Why antenna modeling?

Why antenna modeling?

- Which antenna would be the best choice given your QTH/XYL/budget constraints.
- Antenna home-brewing.
- Antenna shopping- performance comparison/validation.
- Multi-band antennas- check performance by band.
- Determine effects of raising or lowering an antenna.
- Check interactions on multiple antenna installations.
- Saves time, money, and frustration.

Why antenna modeling?

Total Field

EZNEC+

14.2 MHz

Azimuth Plot		Cursor Az	156.0 deg.
Elevation Angle	12.0 deg.	Gain	-5.93 dBi
Outer Ring	12.5 dBi		-18.43 dBmax
			-18.43 dBmax3D
3D Max Gain	12.5 dBi		
Slice Max Gain	12.5 dBi @ Az Angle = 0.0 deg.		
Front/Back	17.49 dB		
Beamwidth	67.6 deg @ 3dB @ 326.2, 318.8 deg		
Sidelobe Gain	-4.79 dBi @ Az angle = 180.1 deg		
Front/Sidelobe	17.49 dB		

Total Field

EZNEC+

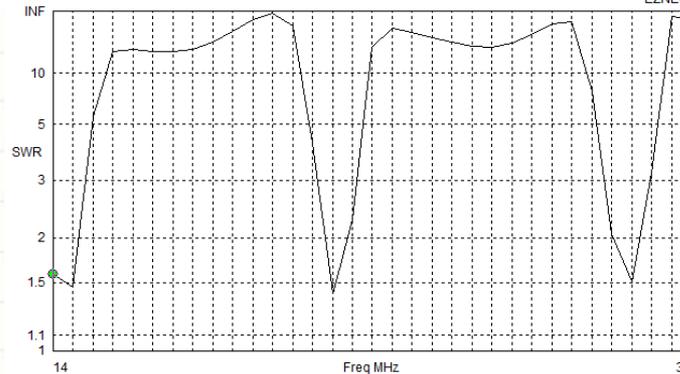

14.2 MHz

Elevation Plot		Cursor Elev	12.0 deg.
Azimuth Angle	0.0 deg.	Gain	12.5 dBi
Outer Ring	12.5 dBi		0.0 dBmax
			0.0 dBmax3D
3D Max Gain	12.5 dBi		
Slice Max Gain	12.5 dBi @ Elev Angle = 12.0 deg.		
Beamwidth	16.6 deg @ 5.9, 5.5 deg		
Sidelobe Gain	-1.5 dBi @ Elev Angle = 29.0 deg.		
Front/Sidelobe	2.0 dB		

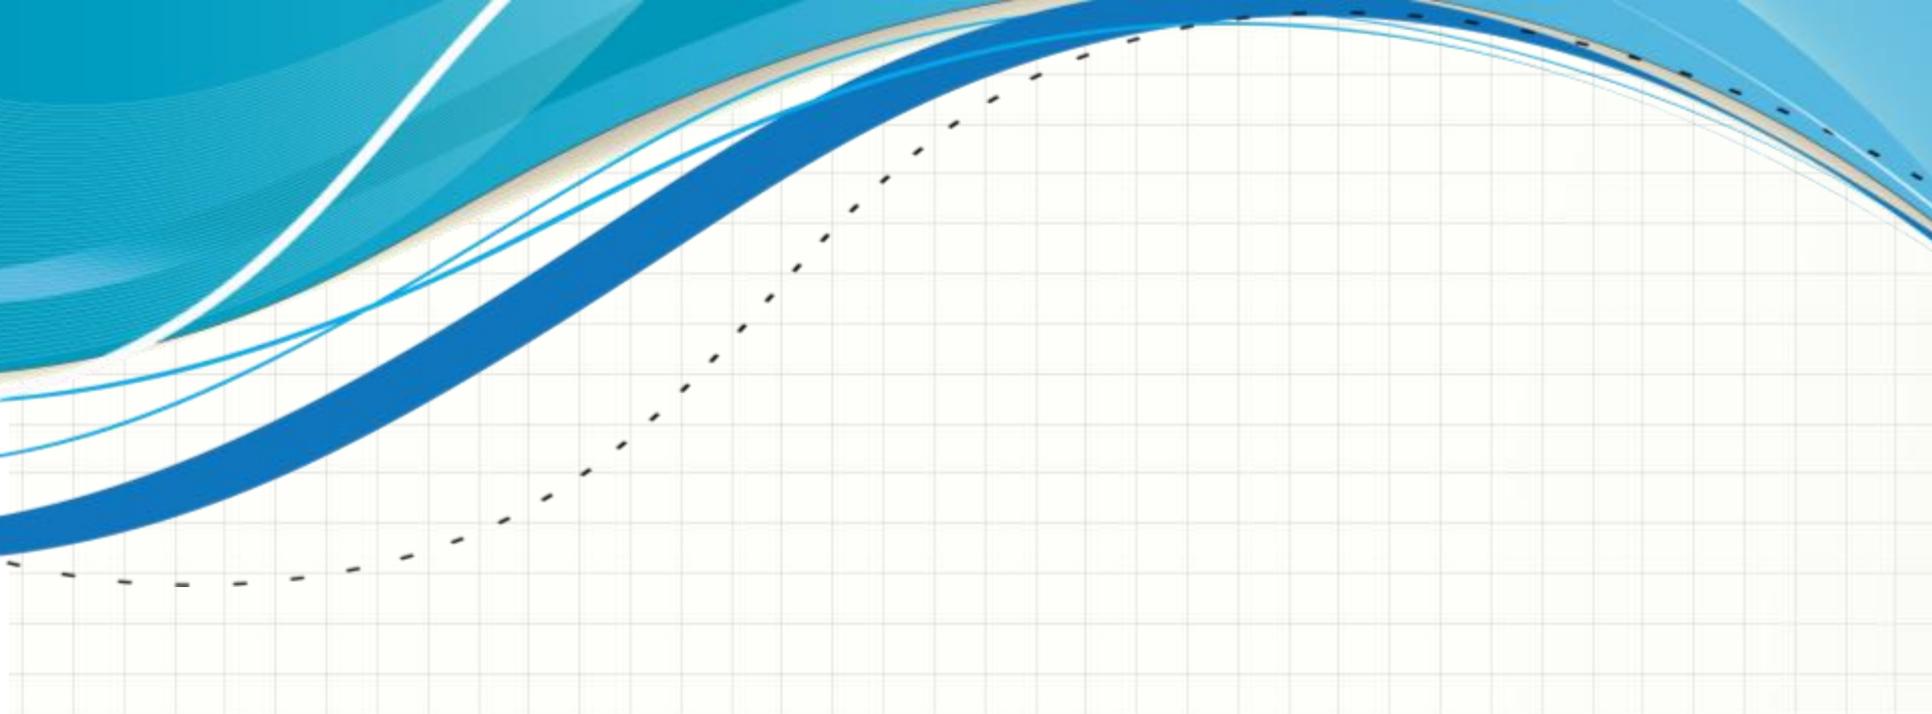

Brings objectivity to a very complex problem

And it's easier than ever

Freq	14 MHz
SWR	1.58
Z	44.53 at -24.68 deg. = 40.46 - j18.58 ohms
Ref Coeff	0.2261 at -105.56 deg. = -0.06066 - j0.2178
Ret Loss	12.9 dB

Source #	1
Z0	50 ohms

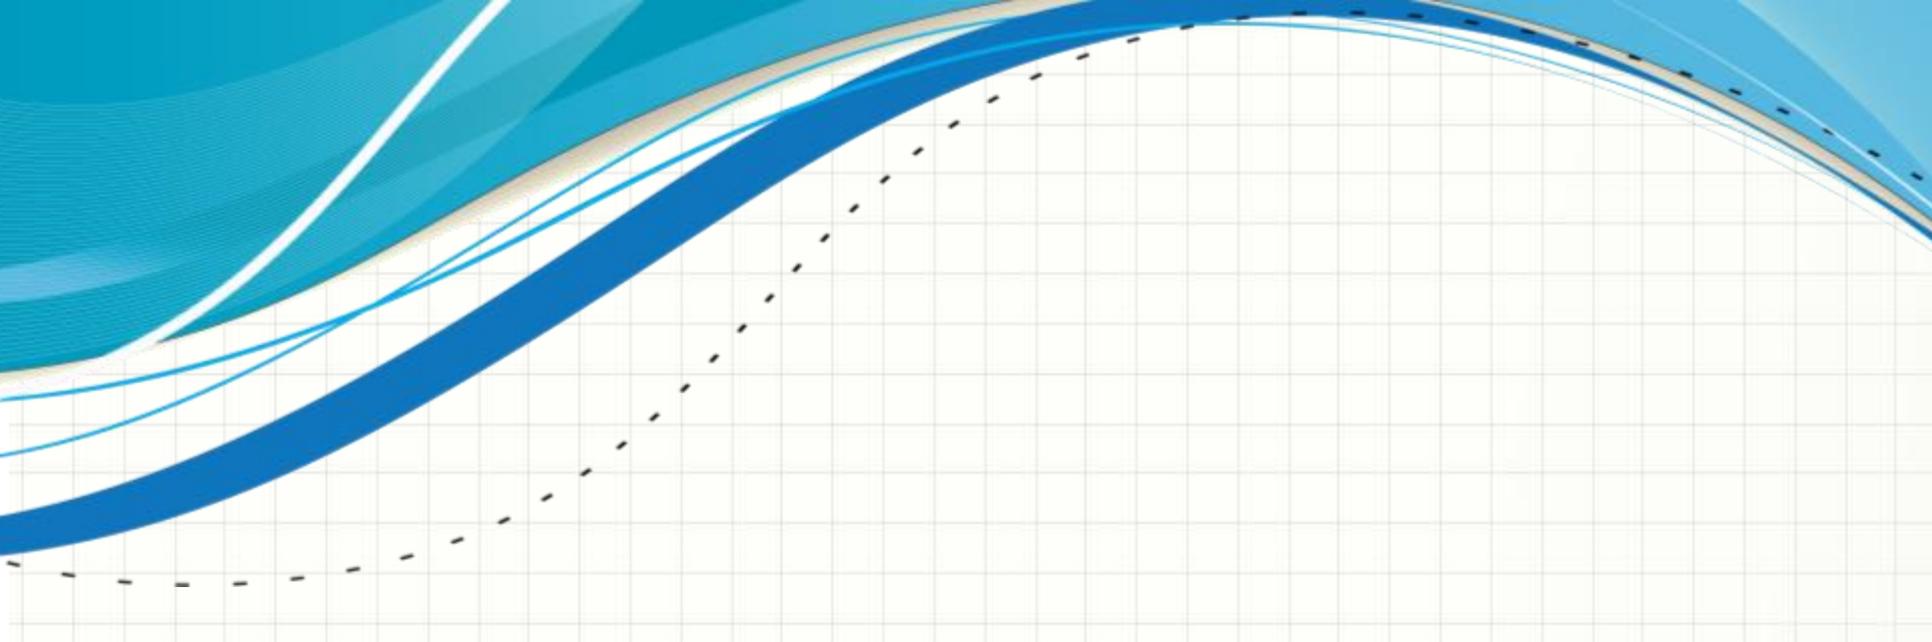

HOW TO GET STARTED

NEC (*neck*)- a modeling engine

- NEC stands for Numerical Electromagnetics Code. Dates back to the 1970's and written in Fortran.
- NEC engine hasn't been updated. However modeling *tools* such as EZNEC continues to advance.
- EZNEC is a modeling *tool* that uses the modeling *engine* NEC. Many other modeling *tools* are available, some are free-of-charge and some are not. The use of the engine NEC-2 is free (public domain).

EZNEC (EZ *neck*)- a modeling tool

- Most popular antenna modeling *tool* (www.eznec.com)
- ARRL free version- unlimited use only on ARRL data files. Comes with the ARRL antenna hand book CD.
- Free trial version- unlimited use on any data file however limited to 20 wire segments.
- EZNEC v. 5.0- \$89; EZNEC+ v. 5.0 \$139; EZNEC Pro v. 5.0 \$650+
- Other free modeling tools are available such as 4nec2 (<http://www.qsl.net/4nec2/>)

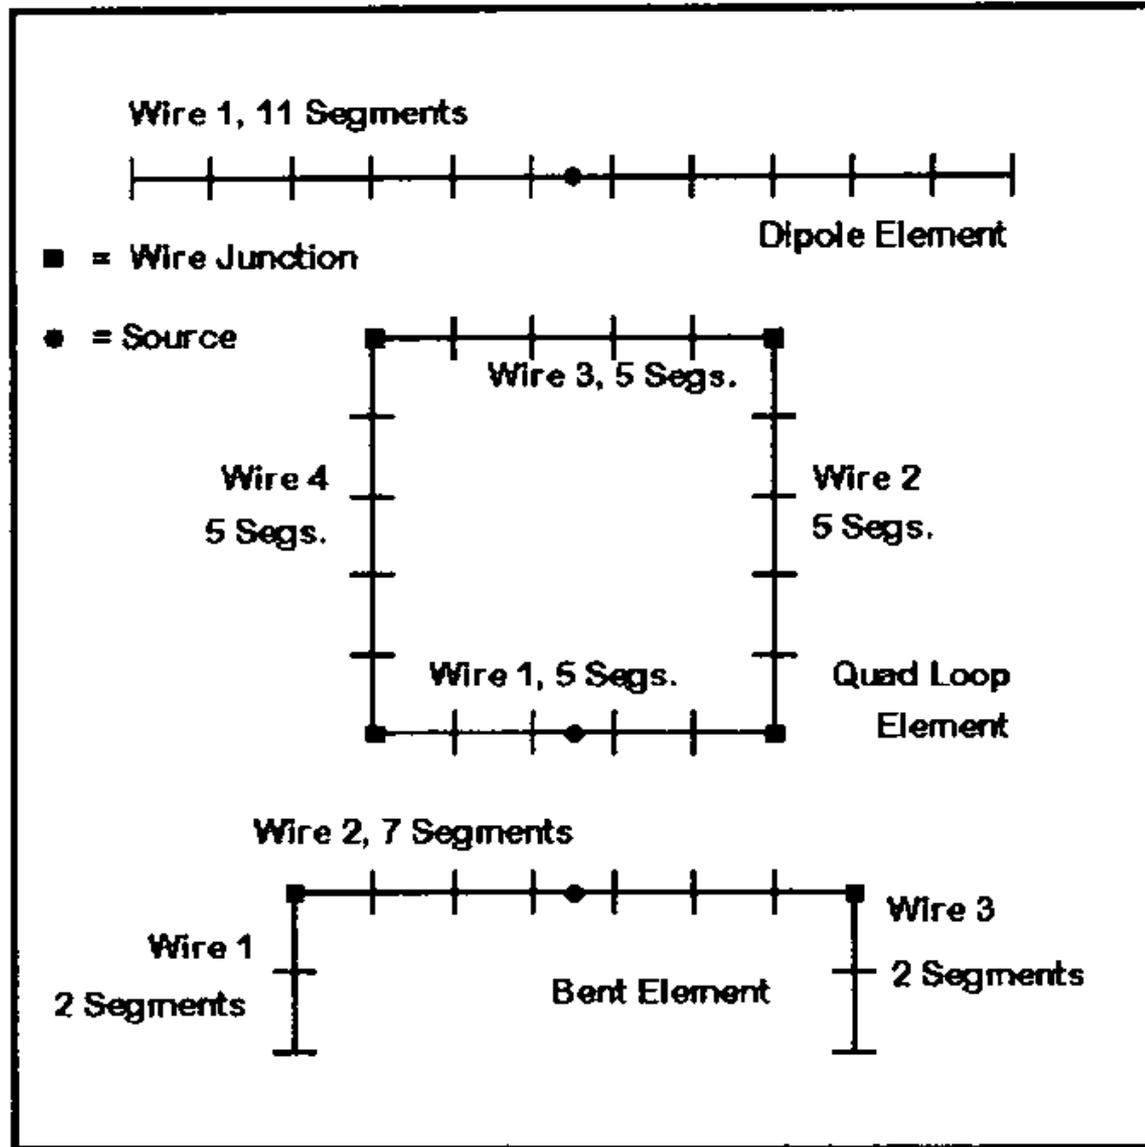

ANTENNA MODELING BASICS

EZNEC Basics

- Wires- antennas are modeled as a collection of *wires*, whether the actual antenna is made of wires, rods, tubing, solid surface, or towers. Anything that radiates need to be defined as a wire or collection of wires. A classic dipole could be modeled as one *wire*.
- Segments- tells EZNEC how to divide up the *wire* for its calculations. Each segment has equal current and other electrical properties in the model. Affects model accuracy.

EZNEC Basics

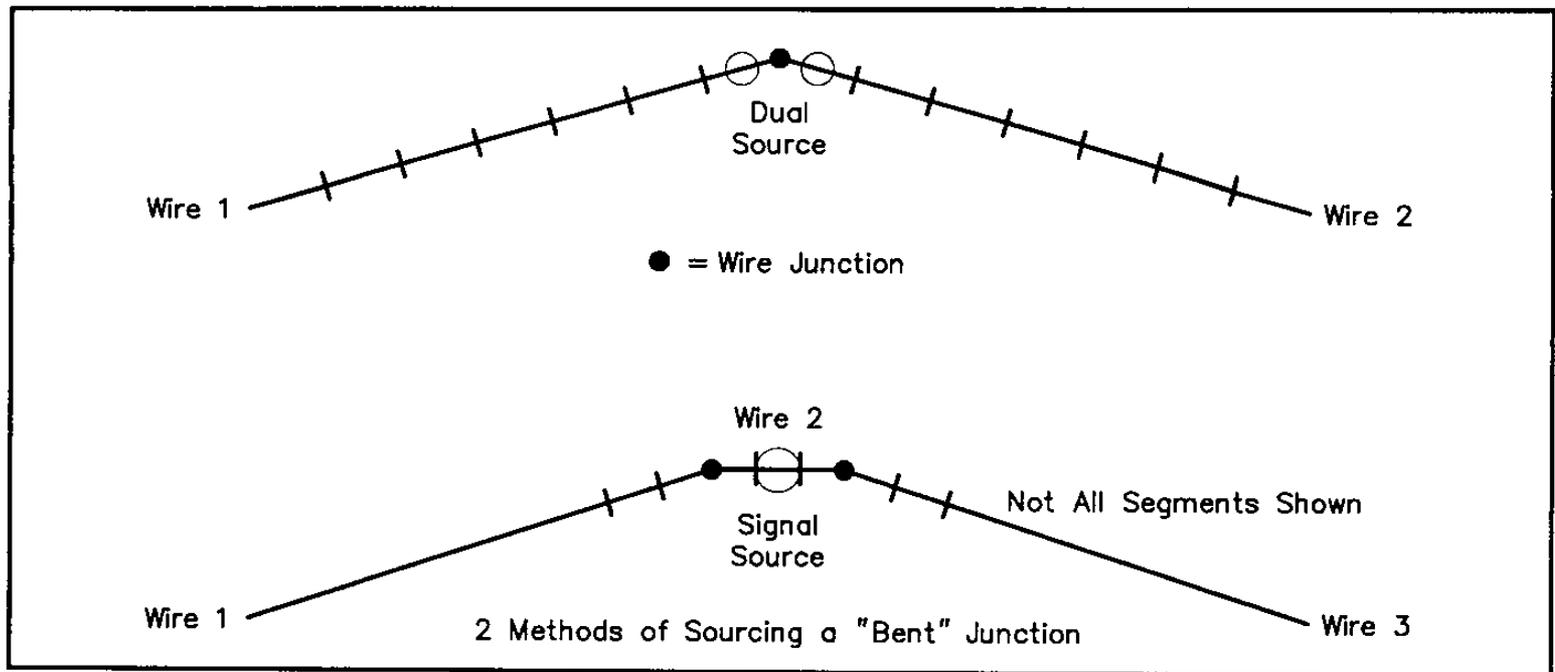

EZNEC Basics

- Wire loss- specify the wire resistance by selecting wire material (i.e. aluminum, copper, etc.)
- Wire diameter- potential impact on modeling output. Different wire diameters necessitates modeling each wire separately.

EZNEC Basics

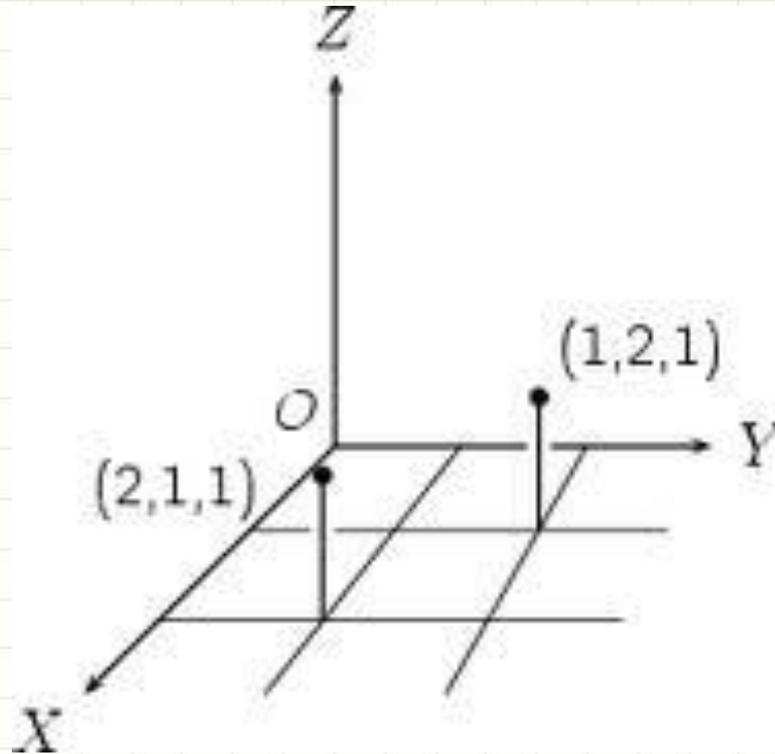

- Sources- bring voltage or current to the wire, aka as a feedpoint. Needs to be placed at the center of a segment.

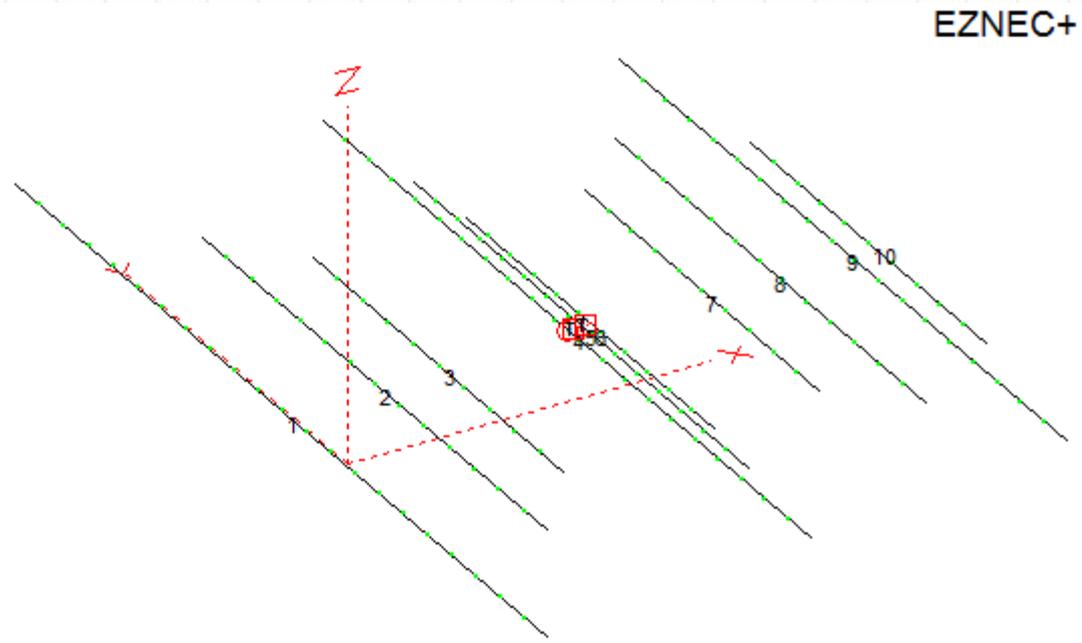

EZNEC Basics

- Ground types- free space, perfect, or real ground
- Loads- lumped impedance (i.e. loading coils, traps, etc.) Three types- $R + jX$, RLC, and Laplace transform polynomials.

Cartesian Coordinates

Cartesian Coordinates

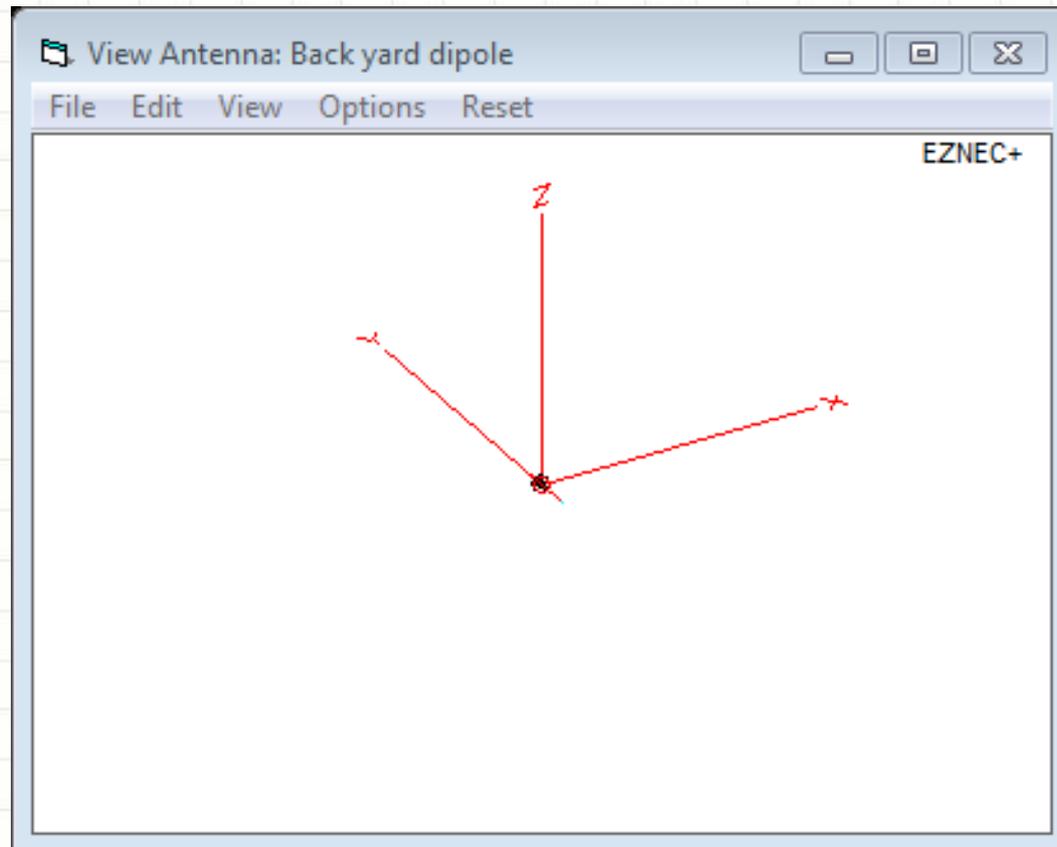

- Modeling convention- on directional antennas keep the firing end along the positive X-axis. Keep the reflector at X=0. The boom at Y=0. Z = height of the antenna.

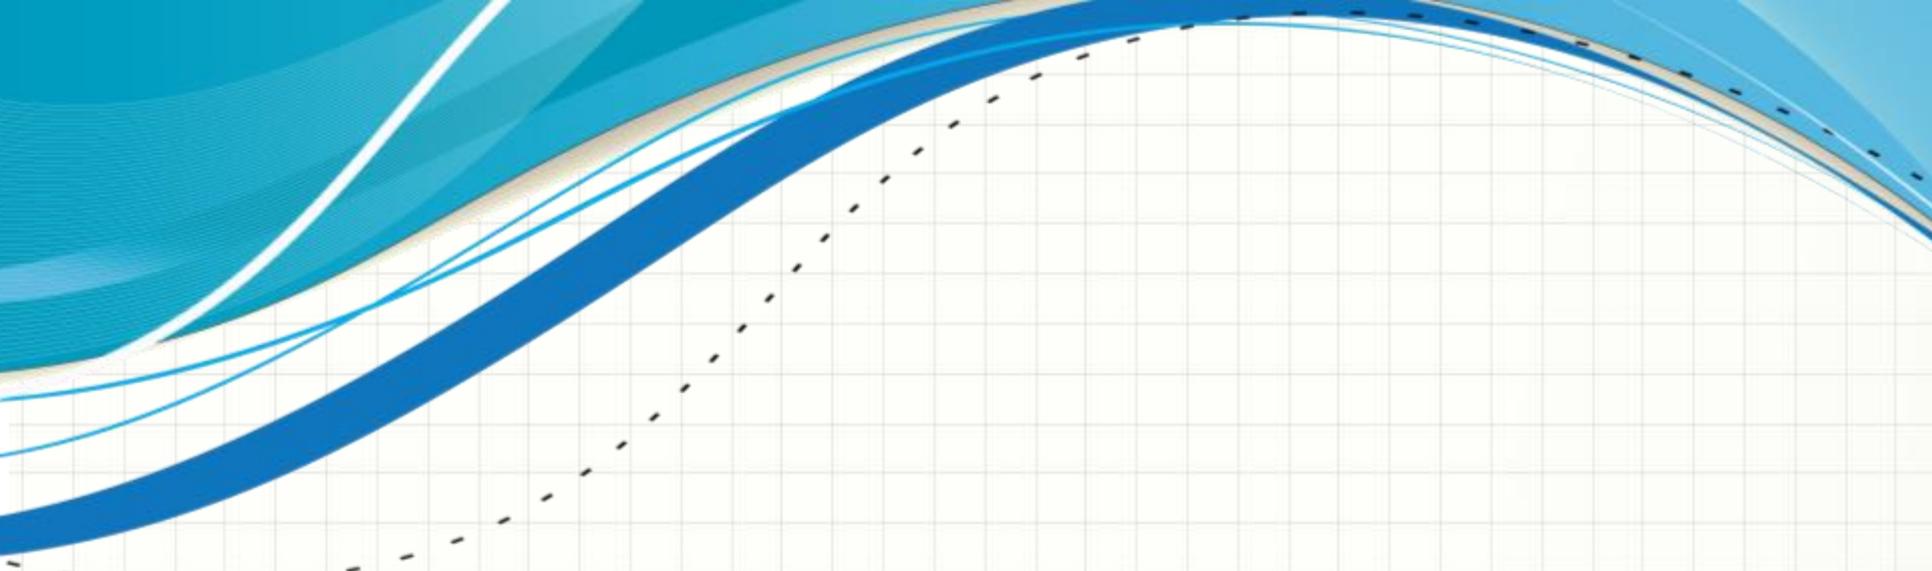

Interpreting the Results

- Currents- checking antenna's operation and to validate the model
- Source data- impedance, SWR, RMS V/I
- Far field plots- 2D azimuth (aka polar plot), 2D elevation, 3D.
 - Gain, beamwidth, F/R, F/S, lobes.
- Antenna efficiency- calculates radiation efficiency
- SWR sweep

Modeling a 20m Dipole @ 30'

- L (length in feet) = $468 / f$ (frequency in Mhz)
= $468 / 14.2 = 32.96'$.
